| <p>N<sup>o</sup> 248. Found at Hard Hills Berlin, Ingleswood Div. by Thomas Wodden and Robert David. Information sent by G. W. Moore, Mining Registrar Ingleswood. G. 75/8690.</p> | 1875.<br>12 <sup>th</sup> May | about 6              | "   | "    | 64                             | 14   | ~   | ~                 | 23½     | Gold 64 14<br>Quartz 7 6             | 33                                        | —   | <p>The mining was through mica ground containing principally of hard white cement. The claim is on the summit of a hill and the surface about six feet above the water level of Williams Creek. The surrounding country is principally granite and quartz. The nugget was found in rough quartz fields westward 50 ft. in. White Silt. garnet bottom. No exposed road.</p> | <p>Through the country presents every appearance of being intersected by numerous quartz reefs none have been worked in the neighborhood.</p>                                                           | <p>The nugget was about six inches long four inches wide and from one to two inches in thickness. Solid gold with one piece of water worn quartz associated with it.</p> <p>The Hard Hills are in a line (nearby X and S.) between Murphys Flat near McIntyre and Langhams Flat, Berlin and that line, some mile in breadth appears to have yielded more nuggets than any part of the surrounding country.</p> |

| N <sup>o</sup> 257. Found by Jara's Hall G. M <sup>rs</sup> 6 <sup>th</sup> Blaine Amherst Div. by Richard Albrecht, Mining Manager, in the sluice boxes. Information sent by Joseph Smith, Mining Registrar, Talbot. | 1875<br>9 <sup>th</sup> Sept.  | —                    | 10  | 4    | 10                             | 2    | —   | 19 <sup>1</sup> / <sub>4</sub> | 23      | 2 dwt. of clay                       | 50                                        | —   | Slate and Sandstone                | 50  | —   | In the immediate vicinity of the line of the Snares Reef | 2 <sup>1</sup> / <sub>2</sub> inches long - 1 <sup>1</sup> / <sub>2</sub> wide and one inch on the thickest part. The nugget is perforated like a sponge.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| N <sup>o</sup> 258 Found by Robert Spinner and his son Robert at Blackwood. Information sent by J. F. Hansen, Mining Registrar, Blackwood.                                                                            | 1875<br>17 <sup>th</sup> Sept. | —                    | 20  | 12   | 18                             | 5    | 18  | —                              | 22.2    | Gold 88.77%.<br>Quartz 11.23.        | 6                                         | 6.  | Surface Soil                       | 1   | 6   | About 500 feet                                           | Honeycombed about 4 inches in length 2 inches in width and half an inch in depth. I had no opportunity of seeing the nugget as the same was immediately submitted to the National Bank for direct purchase. The nugget has not been assayed as it was at once broken up and the usual price for Blackwood gold (£5.17.6. per ounce) paid for the net weight of the gold. The finding of the nugget has been the direct means of Robert Spinner getting married, and it may, therefore, be assumed that it will also have the result of increasing the population of the Colony. |

It was not associated with any other minerals.                                                                                                                                                                                                                                                                                                                                                            |
| 267. Found in the N <sup>o</sup> 1. South Amalgamated Gold Mining Claim by a party of Quartz Miners. at Foster. Information sent by G. B. Murphy - M <sup>o</sup> Registrar. [179/20506] | From the 12 <sup>th</sup> to the 16 <sup>th</sup> of Dec: 1875. | 29 <sup>4</sup> / <sub>16</sub><br>3 <sup>3</sup> / <sub>8</sub><br>1 | 5 <sup>2</sup> / <sub>2</sub><br>0<br>6 | 10<br>0<br>0 | 200<br>50<br>15                | 0<br>0<br>0 |     |                   | 22.2 1/8<br>22.2 1/8<br>22.2 1/8 |                                      | 40<br>40<br>40                            | 0<br>0<br>0 |                                                                        |                       |     |                                        | Taken from a leader about 1 1/2 feet - course North and South underlying Westerly - Got on the slate reef and directly under a rich alluvial patch mixed with broken slate and quartz from the leader. The quartz leader seems to continue solid and defined as far as it has been followed on its course downwards. Manganese seems to be the only accompanying mineral - course of lead seems to be nearly parallel with two others making to to a certain point - will probably join when a good reef may be found to exist. |

| Found at Sawpit Gully, Kingower, by Simon Stephens.               | 1883.<br>18 June             | 16                   | 5   | 0    | 169                            | 18   | 0   | -                 | -       | Est. 169 gr. 18 dwt.<br>Quartz 27 " 2 "                   | 2                                         | -   | -                                  | -   | -   | -                                      | When first unearthed the specimen had the appearance of an irregular jagged piece of quartz - which on examination proved to be thickly interwoven with gold. The finder foolishly placed it in a furnace for the purpose of smelting out the gold, and so rendered the quartz brittle, so a cast could not be taken. |

|                                                                                                                                                                                                                     |                  |                      |     |      |                                |      |     |                   |         | (Note this is the same as 179 in M 19)            |                                           |      |                                                                     |     |          | Mould.                                                                                                                                                      |                                                                            |

The nuggets are now listed in  
the small nugget notice book,  
as hitherto many have been  
missed in this book. M. H. 29/10/24

The theory of the earth's crust is a branch of geology which deals with the structure and development of the solid part of the earth. It is a science which has developed rapidly in recent years, and is now one of the most important branches of geology. The theory of the earth's crust is based on the study of the rocks and the structures which they form. It is a science which is concerned with the origin and development of the earth's crust, and with the processes which are now going on in it. The theory of the earth's crust is a science which is concerned with the origin and development of the earth's crust, and with the processes which are now going on in it. The theory of the earth's crust is a science which is concerned with the origin and development of the earth's crust, and with the processes which are now going on in it.
